

Caesar Cipher

Julius Caesar protected his confidential information by encrypting it using a cipher. [Caesar's cipher](#) shifts each letter by a number of letters. If the shift takes you past the end of the alphabet, just rotate back to the front of the alphabet. In the case of a rotation by 3, w, x, y and z would map to z, a, b and c.

```
Original alphabet:  abcdefghijklmnopqrstuvwxyz
Alphabet rotated +3: defghijklmnopqrstuvwxyzabc
```

Example

$s = \text{There's-a-starman-waiting-in-the-sky}$

$k = 3$

The alphabet is rotated by 3, matching the mapping above. The encrypted string is **Wkhuh'v-d-vwdupdq-zdlwlqj-lq-wkh-vnb.**

Note: The cipher *only* encrypts letters; symbols, such as `'`, remain unencrypted.

Function Description

Complete the `caesarCipher` function in the editor below.

`caesarCipher` has the following parameter(s):

- *string s*: cleartext
- *int k*: the alphabet rotation factor

Returns

- *string*: the encrypted string

Input Format

The first line contains the integer, n , the length of the unencrypted string.

The second line contains the unencrypted string, s .

The third line contains k , the number of letters to rotate the alphabet by.

Constraints

$$1 \leq n \leq 100$$

$$0 \leq k \leq 100$$

s is a valid ASCII string without any spaces.

Sample Input

```
11
middle-Outz
2
```

Sample Output

Explanation

Original alphabet: abcdefghijklmnopqrstuvwxyz
Alphabet rotated +2: cdefghijklmnopqrstuvwxyzab

m -> o
i -> k
d -> f
d -> f
l -> n
e -> g
- -
O -> Q
u -> w
t -> v
z -> b
